

array basics 1

What is array? → list of similar items
 Some type → collection of elements
 data structure → data structure
 data structure → continuous memory location

Calculate space?

Creation of array

int \Rightarrow int arr [127];

char \Rightarrow char alpha [26];

bool \Rightarrow bool flags [27];

long \Rightarrow long num [10];

short \Rightarrow short num [15];

How to check from which address our array starts?

Address operation \Rightarrow & variable name

int arr [10];

cout \ll &arr ;
cout \ll arr ; } some output

Size of array

int arr [10];

Size \Rightarrow size of (arr) \Rightarrow 40 bytes

Length \Rightarrow size of (arr) / size of (int) \Rightarrow 10

array initialization

int arr [] = { 1, 2, 3, 4 } ; \Rightarrow [1 | 2 | 3 | 4]

int arr [5] = { 1, 2, 3, 4, 5 } ; \Rightarrow [1 | 2 | 3 | 4 | 5]

int arr [5] = { 1, 2 } ; \Rightarrow [1 | 2 | 0 | 0 | 0]

int arr [2] = { 1, 2, 3, 4 } ; \Rightarrow error

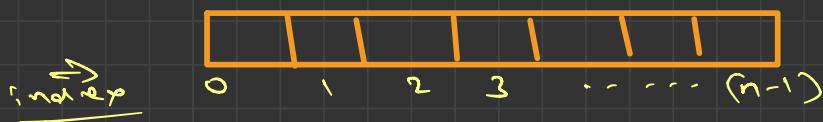

Bad Practice

```
int n ;
cin >> n ;
int arr [n] ;
```

If we don't have the continuous
memory available the user
won't it throw the error

Indexing in array

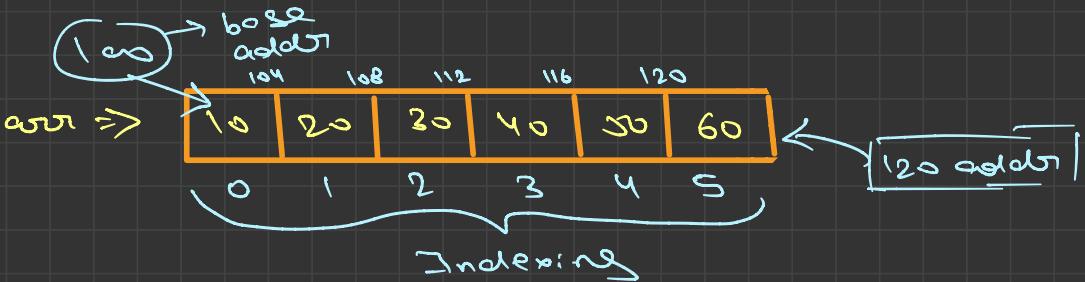

array \Rightarrow n size

Starting from 1 based numbering
0 based indexing

address in array \rightarrow to access the array

$$\text{int arr[7]} = \{10, 20, 30, 40, 50, 60\}$$

formula

$\text{arr}[i] \Rightarrow \text{value at } (\text{Base address} + (\text{size of type} * \text{index}))$

$$\text{arr}[0] = 10 ? \underline{\underline{\text{How?}}}$$

int = 4 byte

arr + indexing * size of int

$$100 + 0 \times 4 \Rightarrow \underline{\underline{100 \text{ addr}}}$$

$$\text{arr}[1] = 20$$

$$100 + 1 \times 4 = \underline{\underline{104 \text{ addr}}}$$

$$\text{arr}[5] = 60$$

$$100 + 5 \times 4 = \underline{\underline{120 \text{ addr}}}$$

Iterating on array

```
int arr[5] = {1, 2, 3, 4, 5};  
int n = 5;
```

```
for (int i = 0; i < n; i++)  
    cout << arr[i] << endl;  
}
```

Input into array

```
int arr[5];  
int n = 5;
```

```
for (int i = 0; i < n; i++)  
    cin >> arr[i];
```

Array & functions

```
int main ()
```

```
{  
    int size = 5;  
    int arr [size];  
    solve (arr, size);  
}
```

```
solve (int arr[], size)
```

```
{  
    //  
    //  
    //  
    //  
    //  
}
```

Dynamic memory allocation

```
int arr [5];
```

Static array \rightarrow static memory allocation

```
int *arr = new int [n];
```

if we don't assign
the values,
it will take
garbage or 0
by itself

\hookrightarrow dynamic memory
allocation (heap)
 \hookrightarrow change the size of
array at runtime

```
int n;
```

```
cin >> n;
```

```
int *arr = new int[n]; // each ele → 0 or garbage
```

// forcing n elements inputs & inserting in array

```
for (int i=0; i<n; i++)
```

```
{
```

```
    int data;
```

```
    cin >> data;
```

```
    arr[i] = data;
```

} // → 0 → 4 index

// let me try to insert more items

// 5 → 14 index

```
for (int i=0; i<10; i++)
```

```
{
```

```
}
```

```
arr[n+i] = 80;
```

It will crash
malloc(): corrupted top size

To overcome this → Vector used
